NutriDay — Calorie Tracker (Brochure)

NutriDay — Calorie Tracker (Demo Project)
A SwiftUI iOS calorie-tracking app built to showcase architecture choices, UX thinking, and software quality.

In 30 seconds

- **What it is**: a simple, fast, day-first calorie tracker.
- **Why it exists**: to demonstrate ownership (structure, testing, scalability) and product thinking (streaks, progress, history).
- **Who it's for**: iOS recruiting (Arise) — a technical demo plus a clear path to evolve into a large-scale product.

Quick demo: what you can test

1. Set / edit the **daily calorie goal**.
2. **Add a meal** (name + calories).
3. Check **daily progress** vs goal.
4. Browse **day-by-day history**.
5. Validate the **streak** logic (days within goal).
6. Review the **7-day trend** chart (Swift Charts).

Features (MVP demo)

- Add meals (name + calories)
- Daily progress bar vs goal

- Streak of days within goal
- Day-by-day history navigation
- 7-day progress chart (Swift Charts)
- Configurable daily calorie goal

Tech stack & choices

- **Swift** 5.9
- **SwiftUI**
- **Architecture**: MVVM
- **Persistence**: Core Data
- **Charts**: Swift Charts

Architecture (repo structure)

`NutriDay/`

- `App/` — entry point, configuration
- `Models/` — domain entities & data structures
- `ViewModels/` — logic, state, rules (progress, streak...)
- `Views/` — SwiftUI UI layer

Design goals:

- Clear UI / logic / data separation
- Readable, “feature-ready” code that’s easy to test
- A foundation that can evolve into a production app (sync, analytics, paywall...)

Getting started

1. `git clone https://github.com/Mody9156/NutriDay.git`
2. `cd NutriDay`
3. `open NutriDay.xcodeproj`

4. Run `⌘R` on an **iOS 16+** simulator

No external dependencies.

Why this is relevant for Arise

Arise (App Store): https://apps.apple.com/fr/app/calcul-calorie-proteine-arise/id549217094

This project highlights:

- **Ownership & maintainability**: clear structure, separated responsibilities, scalability.
- **Daily product usage**: progress, streaks, history — “habit-forming” mechanics.
- **Long-term thinking**: improvements mapped to quality + measurable business impact (measurement, monetization).

Improvement roadmap (toward production)

1) Quality & architecture

- Introduce an explicit **Data layer** (Repository) + protocols for abstraction.
- Set up **dependency injection** (initializers / Environment) to decouple and enable testing.
- Standardize **error handling** (user-facing messaging + logging).

2) Testing & reliability

- **Unit tests** for ViewModels (calculations, streak rules, edge cases, states).
- **UI tests** for critical flows (add meal, switch day, edit goal).

- CI (e.g., **GitHub Actions**): build + tests + (optional) lint on PRs.

3) UX & accessibility

- Improve meal entry: edit/delete, quick add, recent foods, suggestions.
- Accessibility: Dynamic Type, VoiceOver, contrast, tap targets.
- Localization **FR/EN/DE** (aligned with DACH market).

Home screen (suggestions for Arise)

- Improve overall usability: better visual hierarchy, clearer CTAs, stronger empty states.
- Make the Home screen more intuitive (less friction to understand “where I am” and “what to do next”).
- Water log (hydration):
  - Add a **notification** when the daily goal is reached (optional, configurable).
  - Add **visual feedback** (color/badge) when the goal is reached.
  - Add a **warning state** when water intake is too high (color + prevention copy) to highlight risks.
- Leverage the latest iOS capabilities: more modern animations/effects (e.g., optional “liquid glass” styling) while keeping fallbacks and performance in mind.

4) Product & monetization (aligned with the role)

- **Analytics instrumentation** (events): add_meal, reach_goal, streak_break, retention D1/D7.
- **Paywall / subscription** (StoreKit 2) with a clear flow and KPIs (conversion, churn).
- (If infra exists) **A/B testing** for onboarding / paywall.

5) Advanced features

- Macro nutrients (protein / fat / carbs) in addition to calories.
- Food database / barcode scanning (if relevant).

- iCloud sync + backup/restore.
- Widgets / Live Activity for quick tracking.

Note: NutriDay is a concept demo. The roadmap above describes how I would evolve it into a robust, measurable, and monetizable production app.
